

Chapter 3 Practice Test

For questions 1 to 4, select the best answer.

- 1. Which situation involves bias when surveying customers at a restaurant?
 - A Giving questionnaires to every tenth customer.
 - **B** Giving questionnaires to big tippers.
 - C Giving questionnaires to customers whose last name starts with an S.
 - **D** Giving questionnaires to customers if their bill ends in a 0.
- 2. What is the name of a point that follows the trend in the data and affects the slope of the regression line?
 - A outlier
 - **B** bias point
 - C influential point
 - **D** erratic
- 3. The correlation coefficient, r, for a set of data is -0.5. Which percent represents the accuracy of predictions made from a model of this data?
 - A 0%
 - **B** 25%
 - C 50%
 - **D** 100%
- 4. What do you know about the slope of the line of best fit if $r^2 = 0.5$?
 - A It is positive.
 - **B** It is horizontal.
 - C It is negative.
 - **D** It is not horizontal.

- 5. Is each statement true or false?
 - a) Scatter plots display single variable data.
 - **b)** For a cause and effect relationship to exist, a change in the independent variable must result in a change in the dependent variable.
 - c) A dichotomous question is designed to have at least three responses: "yes," "no," and "maybe."
 - **d)** Primary data is information that is made available by others.
- 6. Describe each type of survey question.
 - a) Dichotomous
 - b) Multiple Choice
 - c) Rating Scale
 - d) Completion
 - e) Open-ended
- **7.** Describe the error in regression for each example.

- **8.** A doctor is looking for relationships between her patients' mass and their blood pressure.
 - a) Set up a recording sheet that could be used in this study.
 - **b)** Is the doctor using an observational study, an experiment, or secondary data? Explain.

9. A train driver checked the time since departure when the train passed various checkpoints.

Distance (km)	Time (min)
4	3.0
10	7.5
20	15.0
25	18.75
30	22.5
40	30.0
50	37.5
60	45.0
80	60.0

- a) Draw a scatter plot of the data on graph paper.
- **b)** Describe the relationship between the variables.
- c) Use algebra to determine the equation of the line of best fit.
- **10.** The cost of purchasing one dozen eggs in Canada over several years is shown.

Year	Cost (\$)
1900	0.26
1914	0.45
1929	0.65
1933	0.45
1945	0.56
1955	0.70
1965	0.64
1975	0.92
1985	1.34
1995	1.63
2005	2.22

Perform regression analysis to determine the equation of the line of best fit. Discuss whether a cause and effect relationship exists. **11.** While searching for an apartment in Toronto, Geoff found a property management company that advertised its monthly rent and the floor space of its apartments.

Apartment Area	Monthly Rent
(ft^2)	(\$)
610	700
870	900
579	620
767	850
463	550
930	910
1025	900
700	680
585	644
650	650
752	720
875	850

- a) Make a scatter plot of the data.
- **b)** Is there a cause and effect relationship? If so, describe it.
- c) Use linear regression to model this relationship algebraically.
- **d)** How well does the regression equation fit the data? Explain.
- e) Give the slope and *y*-intercept, and interpret their meanings.
- **f)** Explain how Geoff could use the equation to choose an apartment.
